

## Authentication and authorization with Spring Security

**SecurityFilterChain** in **SecurityConfig.java** is a sequence of filters that Spring Security applies to each incoming HTTP request. The authorized URLs for both the **ADMIN role User** and the **CUSTOMER role User** are defined here. An access denied handler and authentication entry point are also defined here.

If the user is not authorized for the given resources, an exception will be thrown and the method **handle()** in **CustomAccessDeniedHandler.java** will be called.

Also, if the user is not authenticated, an exception will be thrown and the method **commence()** in **CustomAuthenticationEntryPoint.java** will be called.
